

CERTIFIED TECHNICAL ARCHITECT PROGRAM

Sovereign Bank Case Study

WEEK 7

User Experience, Information Architecture, and Interface Design

Recap:

Last week you advised on the platform security architecture that balances regulatory compliance and convenience. You also provided guidance for creating and managing scoped applications with security in mind.

Objective:

Provide a user experience strategy so that the solution is effective, efficient, and desirable.

Capture Sovereign Bank's current information infrastructure to prepare a design that is both logical and user-friendly for its employees and business customers. Advise their developers, user experience experts and architect on the Next Experience framework to develop solutions that provide a modern web-based user experience for the bank employees and customers.

Your audience will be Li Na (Enterprise Architect) and a user experience specialist.

Desired business outcomes:

- Implement the ServiceNow solution in a way that is both technically sound and functionally intuitive.
- Create an accurate view of the bank's current information architecture portfolio in collaboration with Enterprise Architect, Li Na.
- Create modern consumer-grade web-based user experiences utilizing the Next Experience framework.

Key factors to consider:

- Because ServiceNow is new to Sovereign Bank's developers, they want to build custom code 'from scratch', as opposed to relying on existing code libraries.
- Sovereign Bank is currently releasing solutions without going through a proper testing period with actual users.

- Sovereign Bank has an estimated 421 systems or business applications under the Sovereign Bank umbrella.
- Sovereign Bank has over 80,000 employees globally and has struggled to use Remedy, their current ITSM, due to it being highly customized over the years.

Discuss with your small group:

- Consider the technical scripting developers are accustomed to and the current iteration of user experience.
- What information architecture concepts can be utilized to locate all bank systems or business applications?
- In the design for categorizing and organizing content, which scheme (exact or subjective) and organizational structure should be used to keep things simple for users?
- Which key factor(s) above could impede the desired business outcomes? If so, what steps could be taken to proactively address each factor?
- The Next Experience components their developers should utilize.

Recommendation needed:

Prepare a **10-minute** presentation:

- Describe the risks for Sovereign Bank if they do not have user focused solutions. Include a strategy around UX design early, during, and later.
- Recommend which organizational system schemes would fit best with Sovereign Bank's desired outcomes.
- Determine which organizational system structures would provide Sovereign Bank the best way to define their data.
- Determine the best architectural support systems to propose to Sovereign Bank for these areas: labelling, navigation and searching systems.
