

Service Portal

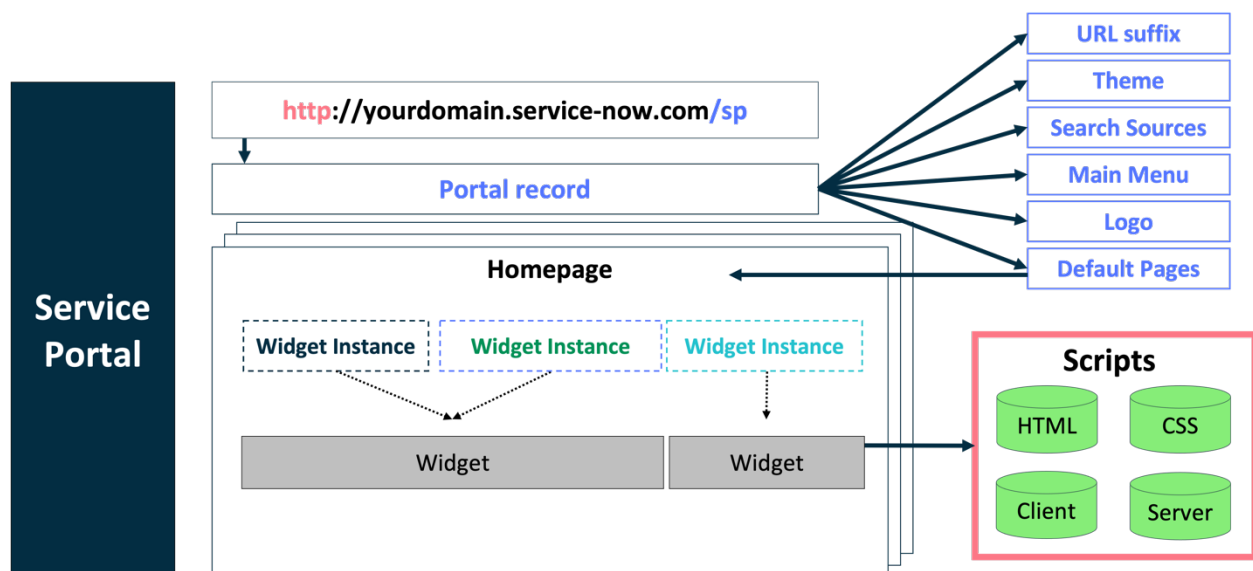

A ServiceNow Service Portal offers an alternative user experience to the standard platform UI. The Service Portal allows you to build a mobile-friendly self-service experience for users. It interacts with parts of the Now Platform, allowing users to access specific platform features through the Service Portal.

Service Portal is:

- A collection of pages offering users an engaging way to access applications, information, services, and tasks
- A visual layer to transform the look and feel of ServiceNow and brings information together in a uniform way
- Easy to use on any device and easy to configure, customize, and extend
- Built on industry standard technologies (AngularJS, Bootstrap, and SASS)

Service Portal framework

Service Portal contains two parts: a framework and a portal. The framework is composed of a set of APIs, Angular services, directives, and tools that help to build portals. A portal is a group of pages linked by page IDs.

QUICK REFERENCE GUIDE

Service Portal framework utilizes the following technologies:

- HTML: Used to create user interfaces for mobile and web applications as well
- Angular JS: Extend the HTML vocabulary for your application. The resulting environment is extraordinarily expressive, readable, and quick to develop.
- The CSS Family
 - CSS: Used for describing the presentation of a document written in a markup language.
 - CSS-SASS: Syntactically Awesome Stylesheets is an extension of CSS that allows the use of variables, nested rules, mix ins, inline imports, and more.
 - CSS-SCSS: Sass CSS builds on existing CSS syntax. Braces and semi-colons are used, it does not care about indentation, and includes all the added Sass features.
- Bootstrap - A collection of tools for creating websites with a mobile-first approach.

What is a Widget?

A widget is technically an AngularJS Directive and consists of four main parts:

1. HTML (View)
2. CSS-SCSS (specific to the widget)
3. Client Script (Controller)
4. Server Script (e.g., GlideRecord, GlideSystem, REST Messages)

It is a leading practice to develop and modify Service Portal widgets using the Widget Editor.

- Widgets are extensible and re-usable. When developing, ask yourself, "Can this be used on another page?"
- Create widgets with reuse in mind, thus making future page development faster

Tools

There are tools available for analyzing usage and maintaining the Service Portal's health.

- Built-in debugging: Send server console logs to the client.
- Widget diagnostic tool: Identify and resolve Service Portal page issues that may be related to a bug in widget code.
- Portal analyzer: A scheduled job that provides a list of all widgets included on all Service Portal pages.
- Log entries: Provides a variety of transaction logs that are used to report on, troubleshoot, and debug.
- Usage overview: Showcases baseline Service Portal reports.
