

Agile Frameworks

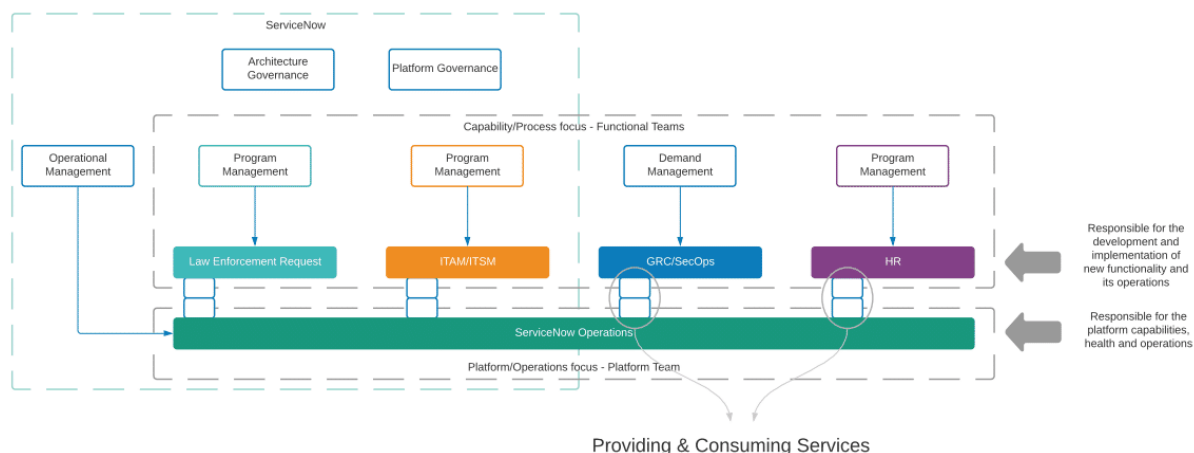

Agile working is about bringing people, processes, technology, time, and place together to find the most appropriate and effective way of working to carry out a particular task. There are many agile ways of working, such as Scrum, Scrum of Scrums, and SAFe.

Most widely adopted agile ways of working

- **Scrum:** An iterative approach to developing working software quickly and more simply
- **Scrum of Scrums:** A scaled agile technique that offers a way to connect multiple teams who need to work together to deliver complex solutions
- **SAFe:** A set of organization and workflow patterns intended to guide enterprises in scaling lean and agile practices. SAFe promotes alignment, collaboration, and delivery across large numbers of agile teams
- **Hybrid:** A combination of agile with waterfall project management

Establish a platform team

It is possible multiple teams want to implement something that is part of the global scope using the Scrum of Scrums and SAFe frameworks. This creates the need for central ownership and maintenance. To address this, consider establishing a platform team next to the functional team.

QUICK REFERENCE GUIDE

Which framework to implement

The table below helps you identify which agile framework is the most relevant given the situation around the development and maintenance of the ServiceNow platform.

Scrum	Scrum of Scrums	SAFe
• Small, colocated, cross-functional teams • A small number of teams (1-2) working together on the same scope • There is no dependency between teams • Product releases involve only one agile team	• Several instances to manage • Agile teams have dependencies for product release • Small teams with less than 50 people working on separate scopes	• Already familiar with agile principles, artifacts, and ceremonies • Dedicated teams, but as usual for SAFe, on a much larger scale; for example, this team is 50 to 125 people • Multiple value streams need to be managed in coordination
