

CERTIFIED TECHNICAL ARCHITECT PROGRAM

Sovereign Bank Case Study

WEEK 8

Service Portal, AI and Gen AI, Virtual Agent and Chat Functionality

Recap:

Last week you crafted a user experience strategy and advised the bank on the Now Experience framework to develop solutions that provide a modern web-based user experience for employees and customers. You also captured Sovereign Bank's current information infrastructure with user experience in mind.

Objective:

Create a Service Portal strategy that ensures ServiceNow's first layer of engagement connects with Sovereign Bank's overall business need and expectations. Create a roadmap for AI and Generative AI implementation.

Your audience will be Albert Wan (Platform Owner).

Desired business outcomes:

- A simplified omnichannel customer support desk.
- A consolidated contact center where users have one place to go for help.
- Improve our agent productivity across IT, Employee and Customer workflows with Gen AI capabilities
- Simplification and automation of processes across the enterprise.
- Enable our admins to code and create playbooks faster for our complex processes.

Key factors to consider:

- Current channels for customer support communication for Sovereign Bank include web, phone, email, and multiple self-service portals.
- Sovereign Bank has not started their journey with Gen AI yet and this implementation will be treated as a pilot for all their other enterprise applications with Gen AI capabilities.
- Sovereign Bank would like to decrease MTTR where applicable, increase deflection rates, improve developer productivity and easily identify and analyze alerts from their infrastructure devices.

Discuss with your small group:

- What challenges will Sovereign Bank have with a new Virtual Agent environment? What can you do to proactively address this and make it a success?
- What Gen AI features can be mapped to their HR, CSM and ITSM modules.
- How can ServiceNow Gen AI functionality help them better analyze their infrastructure alerts?
- What are the key business goals that should be addressed first with implementation of Generative AI?

Recommendation needed:

In a short **10-minute** presentation:

- Connect the benefits of an intelligently designed Service Portal to current Sovereign Bank's needs to show internal and external self-service usage. The results should align to their desired outcomes while minimizing custom development.
- Explain which Generative AI capabilities can be implemented as an MVP (Minimum Viable Product) across IT, HR and CSM modules.
- Create a Gen AI release roadmap to further strengthen Sovereign Bank's agent and developer productivity.
- What are the initial metrics Sovereign Bank needs to capture to show the value and impact of Virtual Agent and Generative AI?
