

CERTIFIED TECHNICAL ARCHITECT PROGRAM

Sovereign Bank Case Study

WEEK 9

Integration Leading Practices, Platform Data and Integration, and Integration Protocols and IntegrationHub

Recap:

Last week you created a Service Portal strategy for Sovereign Bank's internal and external self-service that aligned to their business outcomes. You also created a roadmap for Predictive Intelligence and Virtual Agent. You determined the metrics the bank should monitor to show the value gained from those platform features.

Objective:

Plan a platform core workshop to cover the foundational data elements and establish a strategy for integrating these. Explain where ServiceNow as a platform fits in the bank's enterprise architecture, including the specific integrations required. Determine which ServiceNow integrations should be explored and implemented, while considering integration best practices.

Your audience will be Li Na (Enterprise Architect). (**Note:** The enterprise architect is taking on the responsibilities of the platform architect in this scenario.)

Desired business outcomes:

- Integrate and automate multiple systems and platforms, including both HR systems of record and Slack.
- Authentication: SAML 2.0 integration between the ServiceNow instances and the Sovereign Bank identity providers.
- Centralized access management: BU's who manage their user and group access centrally, regardless of the application system will do so externally to ServiceNow within Azure, Active Directory, or some other enterprise directory service.
- Ensure the bank leverages the most of ServiceNow's integration capabilities by developing a menu of integration recommendations.
- Clearly articulate the best options based on the bank's technology stack without overwhelming the team with technical jargon.

Key factors to consider:

- Sovereign Bank does not want a 'big bang' release.
- Sovereign Bank operates in a siloed-manner, and often senior management are not all on the same page when it comes to decision making, which is creating significant roadblocks.
- The bank has many external platforms, some of which may integrate with ServiceNow, but it is all very confusing to them, and they are getting frustrated. They are not sure how they should prioritize integration.
- Integrations must navigate specific IP restrictions and firewalls need to be configured to allow access. For bespoke systems classified as highly critical, additional requirements like mutual authentication exist.
- IT management is currently perceived as time consuming and challenging to work with. They want to simplify and standardize the way they implement integrations with the ServiceNow platform so that their internal business partners do not feel overwhelmed at the amount of work involved and are able to deliver value faster.
- Due to past mergers and acquisitions, Sovereign Bank has more than one Enterprise Service Bus and there is no common landscape. A sister project has already been launched to harmonize the landscape and should go live within 12 months.

Discuss with your small group:

- How to prioritize recommended integrations, while balancing the bank's most immediate needs, the bank's appetite for change, provide clarity to senior management and get buy-in on a path forward.
- How to prepare and support the bank IT teams and guide them to the appropriate integration solutions.
- What Sovereign Bank needs to understand about foundational data elements and consider when establishing their data governance policy.
- What concepts to utilize to protect the overall platform functionality and capabilities while preserving data integrity with integrations.
- Which integration patterns will be best for Sovereign Bank and why.
- Approach to integrating to the bank's TIBCO Enterprise Service Bus.
- Other systems with which the platform will need to integrate.

Recommendation needed:

Prepare a **10-minute** presentation:

- Propose a strategy for integrating ServiceNow foundational data elements. Include an explanation where ServiceNow as a platform fits in to Sovereign Bank's enterprise architecture. Recommend the specific integrations required to set up the core elements of the platform and support the processes in scope.
- Develop a prioritized list of ServiceNow integration recommendations to IT Senior Management that demonstrates your knowledge and implementation experience of ServiceNow Integration protocols with an incremental release strategy.
- Support your assumptions on how and why you came to your recommended prioritization.
- Put together key integration leading practices with high level examples relevant to Sovereign Bank.
