

CERTIFIED TECHNICAL ARCHITECT PROGRAM

Sovereign Bank Case Study

WEEK 10

Design and Optimize Intelligent Workflows, Process Automation Designer, and Citizen Developer

Recap:

Last week you proposed a strategy for integrating ServiceNow foundational data elements and explained where ServiceNow as a platform fits in to Sovereign Bank's enterprise architecture. You prioritized ServiceNow integration recommendations and ensured integration leading practices were followed.

Objective:

Design a use case where Process Automation Design (PAD) is a viable solution for Sovereign Bank and gain buy-in. Outline considerations needed to establish a governance model for a citizen development program and determine high-value application(s) that could be created using citizen developers. Ensure the analytics are built from the very beginning for citizen-developed applications.

Your audience will be Li Na (Enterprise Architect) and Albert Wan (Platform Owner).

Desired business outcomes:

- Cross-enterprise workflows with a single, unified process, which includes a task-oriented view of processes.
- A citizen developer governance model for Sovereign Bank, including roles, responsibilities, standards, training requirements, and skill set levels.
- Reduce IT workload by empowering citizen developers with the tools and processes needed to build their own applications on the Now Platform.
- Technology to allow Sovereign Bank staff to map KPIs to business goals and continually improve performance.

Key factors to consider:

- Due to historical mergers at Sovereign Bank, different divisions in the organization have slightly different incident management processes.
- Most of Sovereign Bank's current ITSM processes use scripted assignment and approval rules to compensate for poor configuration management data.

- Currently, Sovereign Bank has two different HR systems of record, SAP SuccessFactors (EMEA and Asia) and Workday (North America).
- Sovereign Bank currently has a number of services provided by outdated systems or housed on hardware not compatible with patterns offered by ServiceNow.
- None of the bank's current platforms have intelligent workflows, so you should assume they know nothing about leveraging analytics to develop intelligence.
- 200+ KPIs currently reported on, through a mixture of data extracts and Tableau.
- Program Director, Albert Wan has the ear of Project Sponsor Zhang Wei, and will be the owner of this platform and plans to drive business requirements through process change.

Discuss with your small group:

- How could the high-level concepts of Process Automation Design provide Sovereign Bank a single, unified incident management process?
- What are the challenges of introducing Process Automation Design to the bank based on ITSM history and platform requirements?
- What key concepts from the PAD architecture and process should you keep in mind to create the use cases?
- How can you use your knowledge of PAD benefits and limitations to your advantage? How will this impact your presentation to the Sovereign Bank leadership team?
- What is the impact of a well-planned governance model for the bank's citizen developer program? What would be the impact if just one key aspect is missed, such as training?
- Different solutions ServiceNow offers that use analytics to make intelligent workflows from an implementation-architecture perspective.

Recommendation needed:

Prepare a **10-minute** presentation:

- Describe one good PAD use case idea for Sovereign Bank. Keep it high level but be sure to include the situational problem and main process steps to fully complete the test. Include the roles and related job functions from Sovereign Bank and ServiceNow that will support the use case.
- Using the three major pillars of the citizen developer framework as a guide, create a high-level outline based on Sovereign Bank's current integrations which will be used as part of PAD and environment, to establish a governance model.
 - Enable: What are the appropriate Sovereign Bank's roles and the skillsets needed for this program?
 - Equip: What data dependencies and relationships to keep in mind, such as support for invoking integrations from another system as well as adherence to integration leading practices?

- Control: What performance and hygiene environmental leading practices, as well as data integrity and security, are critical for the program's success?
- Describe a high-value application that would empower citizen developers and reduce the risk of teams turning to other systems.
- Describe how Sovereign Bank will leverage tools to monitor proficiencies after go-live to optimize processes.
