

Interface Design

The Next Experience enables everyone to build cohesive, consumer-grade, user experiences on the Now Platform. It allows developers to create modern web-based user experiences using reusable web components. ServiceNow provides over 100 baseline components, but developers can custom build them as well.

Next Experience UI Framework allows you to:

- Create a single component to use in multiple places across your applications
- Encapsulate the component's scope to prevent conflicts with other code
- Add properties, slots, and actions to your component, allowing users to customize the component every time they use it in a Workspace

UI Framework elements

- **Now Design System:** Contains all the necessary elements for developers and designers to design, realize, and build products
- **Components:** Components are the building blocks within the Design System for creating a user interface on the Next Experience Framework
- **App Engine Studio:** The App Engine Studio is a development tool for creators of varying skill levels to build applications on the Now Platform
- **ServiceNow CLI:** The ServiceNow CLI is a command-line interface, external to ServiceNow, that allows developers to create, test, and upload components to a platform instance
- **UI Builder:** UI Builder is a WYSIWYG web user interface builder, that allows developers to build pages for workspace and custom portal experiences using components

The benefits of using Next Experience UI Framework

- Moves away from third-party libraries to control Application Programming Interfaces (API)
 - Allows ServiceNow to prioritize features, enhancements, and bug fixes to meet customer needs
 - Reduces duplication efforts with the ability to create reusable elements
 - Ensures visual and functional consistency across ServiceNow's platform products
-

Design System leading practices

Do	Don't
Design and develop cards to only show concise snippets of information	Do not display too much content in a card, making it challenging to find information
Use a highlight value that captures attention and reflects the importance of the task	Do not use a category color that reflects a low-priority status for something important

Advantages of the Next Experience Components

- They are generic and flexible
- They have built-in accessibility (WCAG 2.0)
- They are desktop- and mobile-web ready
- They enable internationalization
- They are compatible across multiple browser platforms

The UI Builder allows you to do the following:

- Toggle between experiences
- Create and configure pages and properties
- Add components to pages by dragging and dropping
- Configure and style your components
- Set up and consume data resources
- Create client state variables
- Create client scripts
- Open the rendered version of your page
- Change application scopes and domains
