

User Experience

User experience (UX) focuses on having a deep understanding of user's needs, values, abilities, and limitations. User Experience refers to how people interact with the company, its services, and its products. In the digital world, user experience refers to everything that affects a user's interaction with a digital product.

Principles of user experience design

Design thinking is an approach to problem-solving that is user-centric, co-creative, experimental, and iterative. Key components of design thinking are:

- Discover: Get deep empathy to understand and define the problem
- Ideate: Go broad and explore ideas and narrow on the best possible solution through validation
- Deliver: Go through a process of rapid iteration to develop, test, and refine the solution, to deliver the ideal outcome

User experience design process

Various tasks and techniques are completed during each stage, allowing progress toward both achieving desired outcomes and providing a great user experience.

Early	During	Later

QUICK REFERENCE GUIDE

User interface design leading practices

User interface design focuses on anticipating what users might need to do and ensures that interface elements are easy to access, understand, and use to facilitate users' actions.

- Keep the interface simple
- Create consistency and use common elements
- Purposeful page layouts
- Strategic use of texture and color
- Create and adhere to typography hierarchy and clarity
- The system informs the user of status (i.e., location, actions, changes in state, errors)
- Placement of defaults to reduce user burden

Interaction design leading practices

Interaction design focuses on creating functionality-centric, engaging interfaces with well-thought-out behaviors.

- Define how users can interact with the interface
- Give users clues about behavior before actions are taken
- Anticipate and mitigate errors
- Consider system feedback and response time
- Strategically think about each element
- Simplify for learnability

Considerations for the table form

It is possible that cultural elements will change what different regions feel to be the best form layout. Review the following considerations when designing for UX.

- Logical form layout (this can be very subjective)
- Field data type
- Inclusion of appropriate fields with clear labels
- Tooltips to offer guidance
- Feedback to users through message options
- Effective use of color (including accessibility)
- Logical groupings of fields in sections
- Hints, annotations, and UI policies (make mandatory, hide, set read-only)
