

Virtual Agent and Chat Functionality

ServiceNow Virtual Agent is an enterprise workbot solution that empowers customers, partners, and employees with consistent, scalable, and always-on self-service interactions. Virtual Agent helps solve ordinary issues and delivers results for common requests.

Virtual Agent benefits

- Leverage the power of the ServiceNow Platform and can integrate with other 3rd party chat solutions and applications
 - Provide customers and employees instant answers through 24/7 automated support
 - Reduce agent workload by automating routine responses, using machine learning for predictive routing and issue resolution
 - Reduce costs while handling increased volumes of routine tasks.
 - Visually build conversations and use pre-built templates for IT, HR, and customer service topics to rapidly deliver change to the enterprise
 - Use data from the Now platform to build context-driven chatbots and personalize the conversation
-

Prerequisites

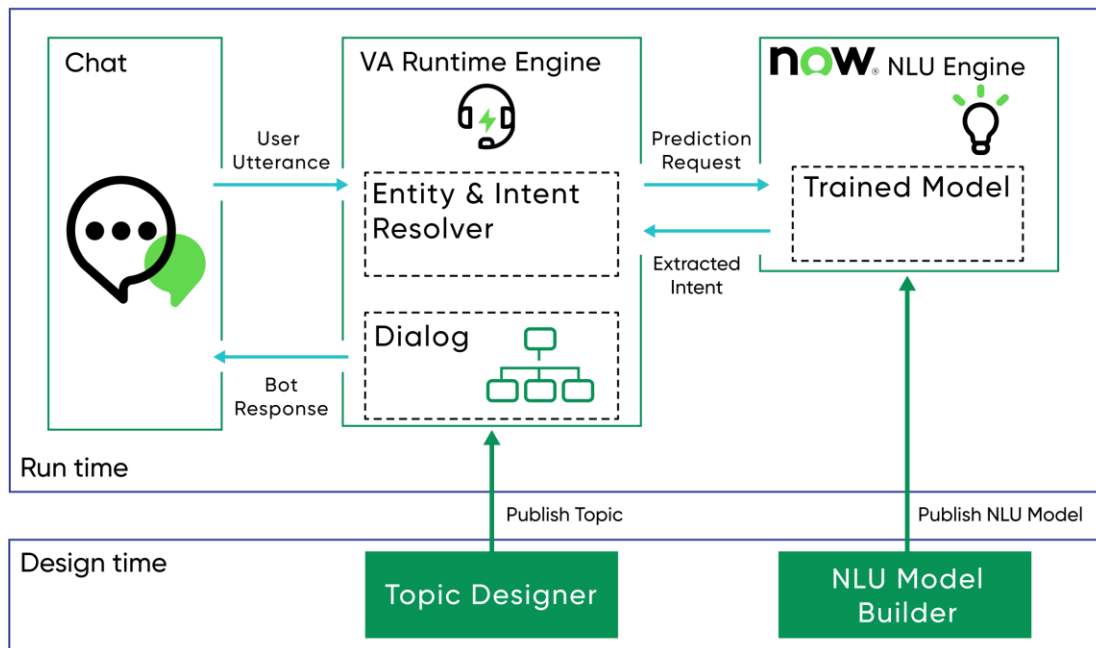

There are five things you should consider as you advise your customer to implement their Virtual Agent.

- Ensure the implementation owner leverages the [Virtual Agent Deployment Guide](#). Familiarize yourself with the critical success factors
1. Confirm that foundational ServiceNow capabilities (based on your use cases) are already deployed and in use
 2. Think about how you will surface Virtual Agent to the end users and how it will fit in your IT landscape
 3. Think about all systems that may interact with Virtual Agent. These systems will have an impact on architecture and process design
 4. Understand the key roles specific to Virtual Agent that will be required to deliver and maintain a successful implementation

ServiceNow Virtual Agent architecture

The Virtual Agent consists of a few different components that create the experience for the end-user. The following diagram shows the high-level building blocks of the Virtual Agent that need to be installed and configured.

Most common ServiceNow applications used with Virtual Agent

- Service Portal
- Service Catalog
- Knowledge Base
- Mobile
- IT Service Management (ITSM)
- HR Service Delivery (HRSD)
- Customer Service Management (CSM)
- Performance Analytics

VA key considerations

- Keywords vs NLU considerations: Recognition of specific Keywords or Recognition of Intent Using Natural Language Understanding (NLU).
- Live agent handoff: Seamlessly transfer the entire conversation history and context to the right human agent so they can quickly address any escalations and resolve user issues.
- Language support: Prepare the Virtual Agent to interact in multiple languages.

Virtual Agent integrations

There are three types of Virtual Agent integrations to external systems.

- Messaging Applications: Integration with enterprise messaging applications that allow the ServiceNow virtual agent to be accessed and used through the messaging application.
- External Systems: Integration with external systems to augment data, fulfill a request, or resolve an incident or case.
- API Integration: Integration using Virtual Agent API, a framework consisting of REST APIs with standard request/response payload to enable customers to integrate with ServiceNow.

Virtual Agent success metrics

Some of the key success metrics to improve VA:

- Adoption rate
- Experience
- NLU Performance
